

## Editorial

Recent trends in industry innovation make polymer further important. Industry 4.0, reshoring, 3D printing and so on, all these recent issues consider polymer the core material. Mass production of polymer merchandises causes debate on sustainability and recycling. Biodegradability fundamentally alleviates concerns regarding those matters. In this issue of *Journal of Composites and Biodegradable Polymers*, we present papers on application of PVA-Coumarin films, biodegradation of polymers and soy protein composites. All these articles will provide readers with valuable information on biodegradable polymer materials.
